The Kubrick theme, originally created for WordPress and ported as GPLed software to nearly 30 CMS and blog scripts, is now available for Tiki. This clean and simple design has been very popular especially with bloggers. For Tiki, Kubrick can expand horizontally to accomodate large gallery images, tables, and other wide content.

The left column modules are stacked under the right column's to save space and conform to the original Kubrick look. Please visit   for more information. The archive can be downloaded   , and the   is the place for support questions and other discussion about this theme.
